/ tlope="Organ: Und; Vector: pT773D-pac (Pharmacia) with a modified polylinker; Plasmid DNA from the normalized library NCI_CGAP_LUS was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 144920-1417991 and 1520904-1523439). Subtraction by Bento Soares and M. Fatima Bonaldo."

NCI CGAP FT1 is a normalized cDNA library constructed from a pool of 81 RNA samples from Alveolar Macrophages challenged with different treatments. The mRNA samples were a mixture of these conditions (times refer to incubations following isolation by bronchoalveolar lavage) (some normal donor macrophages were cultured in some of the conditions, other donor macrophages in different conditions, others pamples were pooled for library construction. Control 0 hours; control 3 hours; Klebsiella moi 10, 24 hours; Rtabsiella moi 10, 24 hours; Rtabsiella moi 10, 24 hours; Adenoviral vector (Ad5 CMV eGFP), moi 500, 24 hours; Adenoviral vector (Ad5 CMV eGFP), moi 500, 24 hours; Ad vector + LPS 3 hours; wt adenovirus moi 500, 3 hours; wt adenovirus + LPS 24 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 24 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 24 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 24 hours; wt adenovirus + LPS 24 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 24 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 24 hours; wt adenovirus + LPS 3 hours; wt adenovirus + LPS 24 hours; wt adenovirus + LPS 3 hou
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TAG TIŠSUE=Human Lung Alveolar Macrophage

Granulocyte macrophage; colony stimulating factor; GM-CSF; cancer; ds. DNA fragment of pAEO-GMCSF encodes granulocyte macrophage colony stimulating factor (GM-CSF) H. 89EP-00113607. 88CA-00572956. AAQ03221 standard; DNA; 905 (first entry) (CANG-) CANGENE CORP. gb. Streptomyces 24-JUL-1989; 25-JUL-1988; 12-JUL-1990 31-JAN-1990 EP352707-A. AAQ03221; RESULT 1 AAQ03221

Garvin RT, Malek LT;

WPI; 1990-031296/05.

gene expression system directing secretion of protein in Streptomyces contg. structural gene, esp. for granulocyte macrophage colony stimulating factor, and regulatory sequence.

Disclosure; Fig 4; 39pp; English.

GM-CSP, or a wide range of other proteins, is secreted in unglycosylated form, with correctly positioned intramolecular disulphide bonds and full biological activity. pABC.GMCSF contains the BamHI HindIII fragment with an aminoglycoside phosphorransferase promotor and the protease B-endo H hybrid signal peptide. GM-CSF is potentially useful in cancer treatment

DAPO.GMCSF contains the BamHI HindIII fragment with an animoglycoside phosphotransferase promotor and the protease B signal peptide. GM-CSF is potentially useful in cancer treatment

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             364
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  427
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          424
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a DNA sequence comprising a codonoptimized sequence encoding a mammalian granulocyte macrophage-colony stimulating factor (GM-CSF), is new, where the codon optimized sequence is different from the corresponding wild type GM-CSF encoding DNA, where expression of the mammalian GM-CSF. The method is useful as an adjuvant in gene therapy or in vaccination for enhancing an immune response of a mammal to a preventive or therapeutic vaccine, is also useful for treating cancer or for effecting gene therapy. Use of the DNA sequence comprising a codon optimized sequence encoding a mammalian granulocyte macrophage-colony stimulating factor as an adjuvant results in improved gene sequence. The present sequence represents human GM-CSF associated encoding sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          67

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         367
                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a DNA sequence comprising a codonoptimized sequence encoding a mammalian granulocyte macrophage-colony stimulating factor (GM-CSF), is new, where the codon optimized sequence is different from the corresponding wild type GM-CSF encoding DNA, where a codon in the codon optimized sequence has been altered to enhance the expression of the mammalian GM-CSF. The method is useful as an adjuvant in gene therapy or in vaccination for enhancing an immune response of a mammal to a preventive or therapeutic vaccine, is also useful for treating cancer or for effecting gene therapy. Use of the DNA sequence comprising a codon optimized sequence encoding a mammalian granulocyte macrophage-colony stimulating factor as an adjuvant results in improved adjuvant activity when expressed in vivo compared with the native GM-CSF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             68 GCCCGAGCCCGTCCACCCAGCCGTGGGAGCACGTGAACGCGATCCAGGAGGCCCGCAGGC 127

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method of optimising a coding sequence for expression of a protein, based on the amino acid sequence of the protein. This involves the use of a computer to generate a test sequence with m optimisation positions determined for a defined region, in which positions the codon usage is varied. The optimum codon usage at such positions is determined by means of a power function. The steps are relierated with different regions of the sequence, with the optimised codons previously identified being left unchanged during subsequent steps. The method can be used for expression of proteins. The present sequence is a codon optimised version of the human GM-CSF coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Computer optimization of a nucleotide sequence for a protein comprises evaluating test sequences with a quality function to determine the

```
and/or haematopoietic colony stimulating factors) or other interleukin-3

c variants with or without a linker. The methods may be used in vivo to

treat haematopoietic disorders resulting from bacterial, viral and fungal

infections, cancer radiation therapy, chemotherapy or bone marrow

c suppressive drugs. They may also be used in vitro to stimulate bone

marrow and blood cell activation and growth prior to infusion of the bone

c marrow and blood transplants into patients. IL-3 is a haematopoietic

c growth factor which has the property of being able to promote the

survival, growth and differentiation of haematopoietic cells. The fusion

c molecules are characterised by possessing the usual activity of both of

their constituent peptides and further by having a biological or

c physiological activity greater than the additive function of the IL-3 or

second CSF alone (i.e. the peptides act synergistically). Their activity

c may also be further enhanced by the mutations they comprise. The

c variations may further reduce undesirable side effects associated with IL

c used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  213

The invention relates to ex vivo expansion of stem cells, comprises culturing stem cells with a growth medium comprising a chimaera protein, and harvesting the cultured stem cells. The chimaera is based on a mutated human interleukin-3 (IL 3) sequence coupled to a haematopoietic factor (e.g. GM-GSF (colony stimulating factor), CSF-1, G-CSF, G-CSFS-17, c-mpl ligand TPO, MGDF, erythropoietin, IL-1-13, IL-15, IL-16, filt3 ligand, human growth hormone, B-cell growth factor, B-cell differentiation factor, eosinophil differentiation factor and stem cell factor (SCF) via a peptide linker. The formula for the chimaera is given in the specification. Also included is a method for enhancing the efficiency of the transduction of cultured stem cells by a heterologous culturing the stem cells with a growth medium comprising the chimaera (c) culturing the stem cells with a growth medium comprising the chimaera (c) transducing DNA into cultured cells; and (d) harvesting the transduced cells; and enhancing the efficiency of the transduction of cultured stem cells by a heterologous gene. The method is also useful for treating a patient containing a haematopoietic disorder. The expanded haematopoietic cells are also useful in the treatment of cyclic neutropenia, aplastic anaemia, thrombocytopenia, idiopathic neutropenia, melodysplastic syndrome and myelofibrosis. The present sequence is an IL-3 mutant associated DNA sequence is an IL-3 mutant associated DNA sequence is an IL-3 mutant associated DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   555

chimera protein, followed by harvesting of the cultured stem cells. The method of the invention has antianaemic, immunostimulant, immunosuppressive, immunomodulator, antiinflammatory, dermatological, immunosuppressive, cytostatic and neuroprotective applications and may be useful to target haemopoietic calls for gene therapy, preferably for treating patients, having a haemopoietic disorder characterised by decreased levels of system. The expanded ex vivo cells may be used to treat neutropenia, aplastic anaemia, periodic neutropenia, Chediak-Higashi syndrome, system: priodic neutropenia, Chediak-Higashi syndrome or myelofibrosis. The current sequence is that of a DNA related to the human interleukin-3 (IL-3) mutant protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Interleukin, hIL-3; CSF; colony stimulating factor; cytokine; lymphokine;

```
A new fusion protein is disclosed which has the formula R1-L-R2, R2-L-R1, R1-R2, R2-R1, R1-L-R1 or R1-R1, where R1 is a mutant or variant of human interleukin: 3 (hIL-3), R2 is a second colony stimulating factor (GSF) interleukin: 3 (hIL-3), R2 is a second colony stimulating factor (GSF) and specifically claimed examples are shown in AAM792358-R79335 and AAM79242-R79345. The fusion protein is made by recombinant DNA techniques. Specifically claimed examples of DNA recombinant DNA techniques. Specifically claimed examples of DNA recombinant DNA techniques of protein are shown in AAM7916-C97204 and AAM79222-097227. The fusion protein is used to increase haematopoietic sequences which encode these proteins are shown in AAM7916-C97204 and AAM79222-097227. The fusion protein is used to increase haematopoietic cell production. It is also useful as an IL-3 antagonist or as a discrete antigment fragment for production of antibodies useful in immunosassays and immunotherapy. Antagonists are used to block the growth of cartain cancer cells and in treatment of asthma. The fusion protein can also be used to stimulate bone marrow and blood cell activation and growth in vitro before infusion; and to treat diseases characterised by decreased levels of myeloid, erythroid, lymphoid and/or megakaryocyte cells of the haematopoietic system. The protein has the usual activity of both its reduced undesired side effects
                                                                                                                                                                             Fusion proteins comprising a human interleukin-3 variant, a linker and interleukin-3, a variant or a colony stimulating factor - useful to increase haematopoietic cell prodn. in a mammal.

Methods have been developed for treating haematopoietic disorders with fusion proteins comprising recombinant, mutated human interleukin-3 (hlu-5) variants or mutant proteins (muteins) fused with secondary colony stimulating fused with secondary colony stimulating factors) interleukin and/or haematopoietic colony stimulating factors) or other interleukin-3 cand/or haematopoietic colony stimulating from bacterial, viral and fungal infections, cancer radiation therapy, chemotherapy or bone marrow and blood cell activation and growth prior to influsion of the bone marrow and blood cell activation and growth prior to influsion of the bone marrow and blood cell activation and growth prior to influsion of the bone compressive drugs. They may also be used in vitro to stimulate bone marrow and blood cell activation and growth prior to influsion of the bone convert factor which has the property of being able to promote the convertium and differentiation of haematopoietic cells. The fusion molecules are characterised by possessing the usual activity of both of their constituent peptides and further by having a biological or physiological activity greater than the additive function of the IL-3 or second CSF alone (i.e. the peptides act synergistically). Their activity may also be further reduce undesirable side effects associated with IL and ANSASI30 to ANSASI30 to ANSASISO and ANSASISO to ANSASISO ANSASISO TO ANSASISO TO ANSASISO ANSASISO ANSASISO TO ANSASISO ANSASISO TO ANSASISO TO ANSASISO ANSASISO ANSASISO TO ANSASISO ANSASISO TO ANSASISO TO ANSASISO TO ANSAS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 caddaddececedecerecicaacerdaddadacacerdecedecedardaardaaaca 120

                                                                                                                                         ઠ
                                                                                                                                                                    g
                                                                                                                                                                                                                                                                               The invention relates to a novel method whereby stem cells are ex vivo expanded via culturing the stem cells with a growth medium comprising a chimera protein, followed by harvesting of the cultured stem cells. The method of the invention has antianaemic, immunostimular, immunosuppressive, cytostatic and neuroprotective applications and may be useful to target haemopoietic cells for gene therapy, preferably for treating patients chaemopoietic disorder characterised by decreased levels of mayoloid, erythroid, lymphoid, and/or megakaryocyte cells of haemopoietic system. The expanded ex vivo cells may be used to treat neutropenia, system. The expanded ex vivo cells may be used to treat neutropenia, system; clupus erythematosus, leukaemia, mediak-Higashi syndrome, systemic lupus erythematosus, leukaemia, myelodysplastic syndrome or myelofibrosis. The current sequence is that of a DNA related to the human interleukin-3 (IL-3) mutant protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         52 ATGGCGCCAGCGCAGCCCCAGCCCGTCCACCCAGCCGTGGGAGCACGCGAACGCGATC 111

AN A new fusion protein is disclosed which has the formula R1-L-R2, R2-L-R1, R1-R2, R2-R1, R1-L-R1 or R1-R1, where R1 is a mutant or variant of human controlled in the r1-R1 or R1-R1, where R1 is a mutant or variant of human concluding cytokine, 1 graphokine, interleukin, haematopoietic growth factor cor IL-3 variant, and L is a linker. Genetic sequences are described in cor IL-3 variant, and specifically claimed examples are shown in AAR79398-R79335 and AAR79342-R79345. The fusion protein is made by recombinant DNA techniques. Specifically claimed examples of DNA sequences (including the present sequence) which encode these proteins care shown in AAQ7167-Q92204 and AAQ97222-Q97220. The fusion protein is used to increase hematopoietic cell production. It is also useful as an tithodies useful in immunoassays and immunotherapy. Antagonists are used to block the growth of certain cancer cells and in treatment of asthma. The fusion protein can also be used to stimulate bone marrow and blood cell activation and growth in vitro before infusion; and to treat diseases characterised by decreased levels of myeloid, erythroid, Indiseases characterised by decreased levels of myeloid, erythroid, Indiseases characterised by decreased levels of myeloid, erythroid, Indiseases characterised by decreased levels of myeloid, erythroid, Indisease the usual activity of both its component proteins, but may

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
A new fusion protein is disclosed which has the formula R1-L-R2, R2-L-R1, R1-R2, R2-R1, R1-L-R1 or R1-R1, where R1 is a mutant or variant of human interleukin-3 (h1L-3), R2 is a second colony stimulating factor (CSF) including cytokine, lymphokine, interleukin, haematopoietic growth factor or IL-3 variant, and L is a linker. Generic sequences are described in AAW03235 - AAW03242, and specifically claimed examples are shown in ARY9298-R79335 and AAR7924-R79345. The fusion protein is made by recombinant DNA techniques. Specifically claimed examples of DNA sequences (including the present sequence) which encode these proteins are shown in AAQ9716-T09724 and AAQ9722-Q9727. The fusion protein is used to increase haematopoietic cell production. It is also useful as an III-3 antagonist or as a discrete antigenic fragment for production of antibodies useful in immunoassays and immunotherapy. Antagonists are used to block the growth of certain cancer cells and in treatment of asthma. The fusion protein can also be used to stimulate bone marrow and blood cell activation and growth in vitro before infusion; and to treat lymphoid and/or megakaryocyte cells of myeloid, erythroid, lymphoid and/or megakaryocyte cells of myeloid, erythroid, lymphoid and/or megakaryocyte cells of the haematopoietic system. The proteins, but may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        protein has the usual activity of both its component proteins, but may have increased synergistic activity and reduced undesired side effects
                                                                                        Fusion proteins comprising a human interleukin-3 variant, a linker e interleukin-3, a variant or a colony stimulating factor - useful to increase haematopoietic cell prodn. in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                BP; 204 A; 227 C; 183 G; 163 T; 0 U; 0 Other;

mutated other Treating hematopoietic disorders with fusion proteins comprising interleukin-3 fused with secondary colony stimulating factors or interleukin-3 variants. Easton AM, Caparon MH; Braford-Goldberg SR, skearn JP, Olins PO, Mckearn JP, WPI; 2000-160368/14. Paik K, Thomas JW,

Example 27; Col 135-136; 276pp; English.

fusion proteins comprising recombinant, mutated human interleukin-3 (hilltustion proteins comprising recombinant, mutated human interleukin-3 (hillSimulating factors (CSFs) (e.g. cytokines, interleukin)
and/or haematopoietic colony stimulating factors) or other interleukinand/or haematopoietic colony stimulating factors) or other interleukincontraints with or without a linker. The methods may be used in vivo to
treat haematopoietic disorders resulting from bacterial, viral and fungal
infections, cancer radiation therapy, chemotherapy or bone marrow
suppressive drugs. They may also be used in vitro to stimulate bone
constrow and blood cell activation and growth prior to infusion of the bone
constrow and blood cell activation and growth prior to infusion of the bone
constrow and blood transplants into patients IL-3 is a haematopoietic
constrow and blood defferentiation of haematopoietic cells. The fusion
concludes are characterised by possessing the usual activity of both of
their constituent peptides and further by having a biological or
concluded activity greater than the additive function of the IL-3 or
second CSF alone (i.e. the peptides act synergistically). Their activity
concluded the average oundesirable side effects associated with IL
constituent payone reduce undesirable side effects associated with IL
constituent by average the mutations they comprise. The Methods have been developed for treating haematopoietic disorders with represent sequences the present invention AY53130 to AAY53226, and AAA03721 to AAA03782 in the exemplification of the present inventio AAY53130

The invention relates to ex vivo expansion of stem cells, comprises culturing stem cells with a growth medium comprising a chimaera protein, and harvesting the cultured stem cells. The chimaera is based on a mutated human interleukin-3 (IL 3) sequence coupled to a haematopoietic factor (e.g. GW-CSF (colony stimulating factor), CSF-1, G-CSF, G-CSFS-1, To-chill ligand TPO, MODF, erythropoietin, IL-13, IL-15, IL-15, CF12 ligand, human growth hormone, B-Cell growth factor, B-Cell Gfferentiation factor, eosinophil differentiation factor and stem cell cator (SCF) via a peptide linker. The formula for the chimaera is given in the specification. Also included is a method for enhancing the comprising; (a) removing stem cells from a patient or donor; (b) culturing the stem cells with a growth medium comprising the transduced comprising; (a) removing stem cells from a patient or donor; (b) culturing the stem cells with a growth medium comprising the transduced cells. The method is also useful for treating a patient conflex a heartopoietic disorder. The expanded haematopoietic cells by a cherrologous gene. The method is also useful for treating a patient coll avoing a haematopoietic disorder. The expanded haematopoietic cells are also useful in the treatment of cyclic neutropenia, aplastic and coll and myelofibrosis. The present sequence is an IL-3 mutant associated DNA sequence. Note: The present sequence is an IL-3 mutant associated DNA sequence. Note: The present sequence is an IL-3 mutant associated DNA cepture of the present sequence is an interpretation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              615
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         LysGlyProLeuThrMetMetAlaSerHisTyrLysGlnHisCysProProThrProGlu 108

                                                                                                                                                                                                                                                                                                                                                                                         ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel method whereby stem cells are ex vivo expanded via culturing the stem cells with a growth medium comprising a chimera protein, followed by harvesting of the cultured stem cells. The method of the invention has antianaemic, immunostimulant, immunomodulator, antiinflammatory, dermatological, immunosuppressive, cytostatic and neuroprotective applications and may be useful to target haemopoietic cells for gene therapy, preferably for treating patients having a haemopoietic disorder characterised by decreased levels of system. The expanded ex vivo cells may be used to treat neutropenia, applastic anaemia, periodic neutropenia, Chediak-Higashi syndrome, applastic anaemia, periodic neutropenia, Chediak-Higashi syndrome, myelofibrosis. The current sequence is that of a DNA related to the human interleukin-3 (IL-3) mutant protein of the invention.
                                                                                          stem cell; antianaemic; immunostimulant; immunomodulator; antiinflammatory; dermatological; immunosuppressive; cytostatic; antiinflammatory; hæmopoietic disorder; gene therapy; myeloid; erythroid; lymphoid; megakaryocyte; aplastic anaemia; periodic neutropenia; chediak-Higashi syndrome; systemic lupus erythematosus; leukaemia; myelodysplastic syndrome; myelofibrosis; interleukin-3; IL-3; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ex vivo expansion of stem cells, e.g. hematopoietic cells for treating aplastic anemia, involves culturing the stem cells with growth medium comprising chimera protein, and harvesting the cultured stem cells.

                                                                                                           A nucleic acid molecule (AAT72724) codes for a fusion protein (AAM19763) comprising human p53 tumour suppressor protein and granulocyte-macrophage colony stimulating factor (GM-CSF). It was prepd. by PCR amplification of p53 cDNA GM-CSF CDNA sequences (the GM-CSF antiense primer including a hexahistidine tag sequence) and their fusion via a Xbal linker. Fusion expression vectors can be used to transfect mammalian and insect cells. The p53-GM-CSF fusion protein is used to generate anti-p53 immunity. Tumour cells are eliminated by cytotoxic T lymphocytes activated in vivo or in vitro by exposure to antigen-presenting cells exposed to the fusion

                                                                                                                                                                                                                                                                                            The present sequence encodes human granulocyte macrophage colony-stimulating factor (hGM-CSF; n = 101, 11e). A series of oligonucleotides were synthesised and ligated together to form a stable expression construct. The technique is used for the efficient prodn. of a glycoprotein with hGM-CSF activity. The invention relates to the recombinant production of human granulocyte macrophage-colony stimulating factor (hGW-CSF). NcoI and BamHI restriction sites were inserted into hGW-CSF CDNA (ABA96672) via PCR using primers ABA96670-ABA96671, prior to cleavage with these enzymes insertion into the pET-11d vector downstream of the T7/lac promoter to GDCm the plasmid pT7GMCSF. pT7GMCSF was transformed into Escherichia coli sequence represents hGM-CSF cDNA
                                                                                                                                                                        Human granulocyte macrophage-colony stimulating factor (hGM-CSF) cDNA.
                                                                                                                                                                                                                                                          Human; GM-CSF; granulocyte macrophage-colony stimulating factor; recombinant production; Escherichia coli; pET-11d vector; gene; ds.

```

ARA new fusion protein is disclosed which has the formula R1-L-R2, R2-L-R1, R1-R2, R2-R1, R1-L-R1 or R1-R1, where R1 is a mutant or variant of human interestion interleukin-3 (InL-3), R2 is a second colony stimulating factor (CSF) including cytckine, lymphokine, interleukin, haematopoietic growth factor or IL-3 variant, and L is a linker. Generic sequences are described in AAM03223. AAM03232, and specifically claimed examples are shown in AAR03298-R79345. The fusion protein is made by recombinant DNA techniques. Specifically claimed examples of DNA recombinant DNA techniques. Specifically claimed examples of DNA combinant DNA techniques. Specifically claimed examples of DNA combinant DNA techniques. Specifically are shown in AAR097167-067-067-204 and AAR097222-097227. The fusion protein is used to increase heematopoietic call production. It is also useful as an IL-3 antagonist or as a discrete artigenic fragment for production of antibodies useful in immunosassays and immunotherapy. Antagonists are used to block the growth of certain cancer cells and in treatment of asthma. The fusion protein can also be used to estimilate bone marrow and blood cell activation and growth in vitro before infusion; and to treat diseases characterised by decreased to hemmatopoietic system. The protein has the usual activity of both its commonsant rarefering but may have interesting anneary and and commonsant rarefering but has additional and commonsant rarefering both its component proteins, but may have increased synergistic activity and reduced undesired side effects

Example 19; Page 183; 447pp; English.

CC fusion proteins comprising recombinant, mutated human interleukin-3 (hilt-studing proteins comprising recombinant, mutated human interleukin-3 (hilt-stimulating comprising recombinant, mutated human interleukin-3 (stimulating factors (GSFs) (e.g. cytokines, lymphokines, interleukin-3 cand/or haemacopoietic colony stimulating factors) or other interleukin-3 card/or haemacopoietic colony stimulating factors) or other interleukin-3 card/or haemacopoietic colony stimulating factors) or other interleukin-3 card/or haemacopoietic calony stimulating factors bone marrow and blood call activation in therapy, chemotherapy or bone marrow and blood cranaphants into patients. IL-3 is a haemacopoietic growth factor which has the property of being and to promote the currowth factor which has the property of being and activity of both of their constituent peptides and further by having a biological or physiological activity greater than the additive function of the IL-3 or physiological activity greater than the additive function of the IL-3 or comprise. The evend CSF alone (i.e. the peptides act synergistically). Their activity may also be further enhanced by the mutations they comprise. The contituences and further by having a biological or contains may further reduce undesirable side effects associated with IL-3. Are are altitudes and AAA01721 to AAA03121 represent sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       241 ATGGCCAGCCACTACAAGCAGCACTGCCCTCCAACCCCGGAAACTTCCTGTGCAACCAG 300
